Interview Notes

SDG&E Interview Notes Compilation

(2025)

Compiled interview notes from interviews dated 11/04, 11/05, 11/13, 11/14, 11/17, and 11/18 all taking place in 2025.

Narrative by Account

Account E361 — Structures

Security-system upgrades were described as short-lived additions; the underlying station structure population was viewed as having limited operational indicators of material life change (current life noted ~63 years, with analytics suggesting a modest reduction). The analysis reflects a slight reduction to 57-61 years in analytics, depending on the band. Site prep drainage and other assets have similar lives to the current. Security additions are the only new assets in this account.

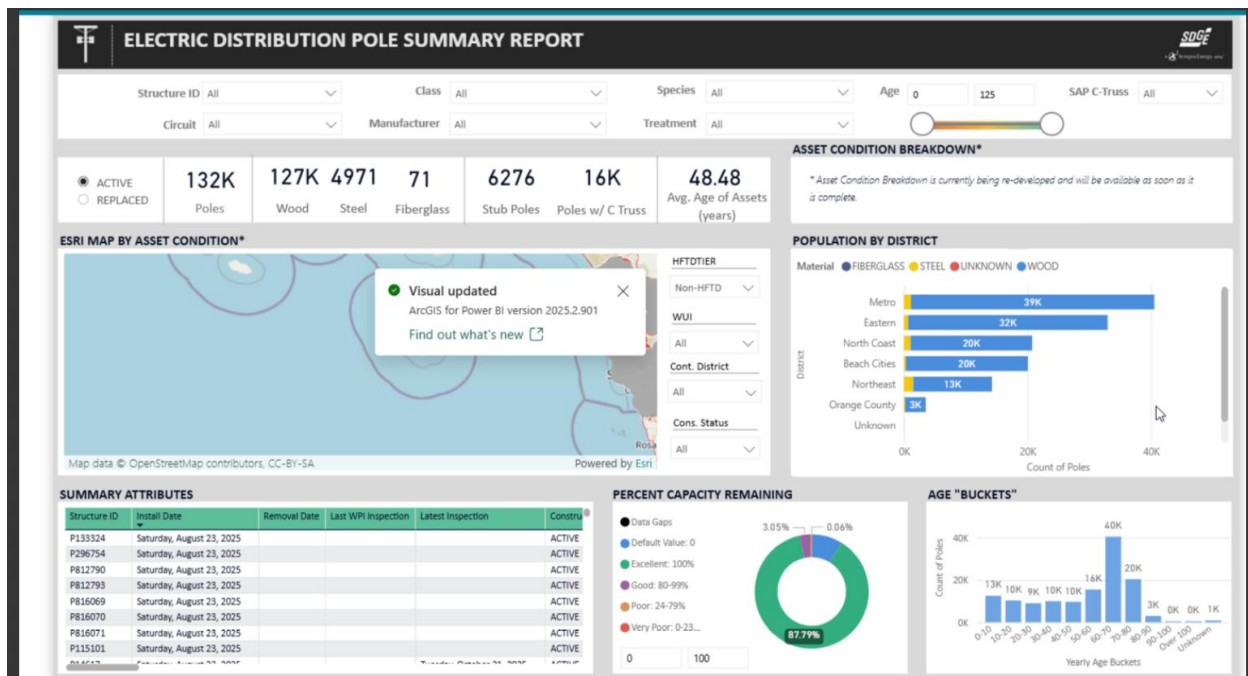

Account E362 — Station Equipment

SDG&E is planning to remove all 12kV - 4 kV substations over the next 10 years (around 10-20 stations out of around 180-200 stations). CBM (Condition Based Monitoring) monitoring is on transformers. Many transformers are older than the 51-year approved life. They would expect transformers to have a 40-60 year life. 30-35 transformers are past the 60-year mark. Breakers are a mix of oil, vacuum, oil and air. Oil breakers are 50 years, vacuum 30, metal clad 30-50 years. Relays – some electromechanical relays on the system but would replace with solid state when replaced. Solid state -20 years, electromechanical 30-40 years. Ground grids – generally will maintain instead of full replacements. Batteries – 10–20-year life. Capacitor banks are a unit of capital, not individual cans. They are more proactive in replacing station assets. They are planning for breaker replacements and replace electromechanical relays. They have enhanced testing equipment that allows for the repair of equipment in some instances instead of having to replace. Deferral of capital replacements could also be a factor. Seeing an increase in life.

Account E364 — Poles

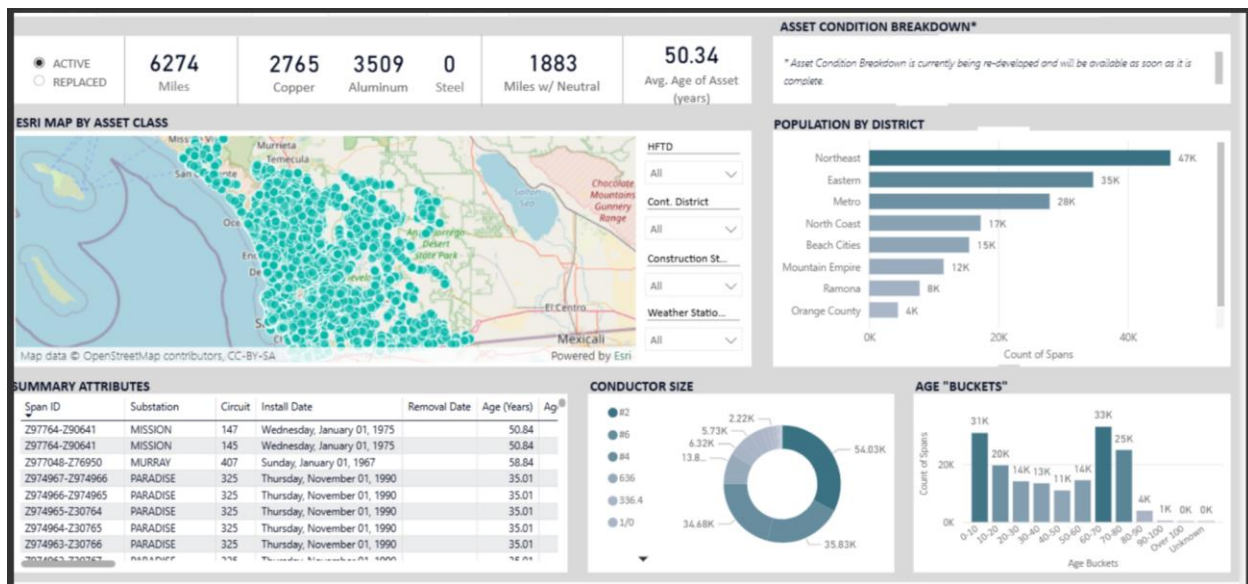

SDG&E described a mix of wood, steel, concrete, and some fiberglass. Steel poles were described as 50+ years (manufacturer and operating experience), wood increasingly being replaced (particularly in fire-hardening areas), and concrete exhibiting spalling/corrosion issues in the 20–30-year range. Undergrounding and system hardening were described as key drivers of early retirements for wood poles and potential “rework” in some semi-hardened areas; a groundline inspection program starting around 2020 was also noted as influencing replacement rates.

Current materials are wood steel and concrete. Steel poles have a 50+ years life per the manufacturer which is also support by operations experience. Wood poles changing to steel 30 or so years. Concrete starts having issues with spalling and corrosion at 20-30 years. Fiberglass 30+ years. 47-year life currently overall. There are still a lot of wood poles outside of fire-hardening areas. There are proactively undergrounding in fire hardening areas. There are some areas that may have had wood changed out to steel in the past but now, based on risk assessment, might move to undergrounding or replacing with covered wire. The undergrounding effort will not have a material impact on the overall account (Installing 880 miles of underground to convert 587 miles of OH). Some portions of the steel poles and areas that has already been hardened that may need to be reworked. The largest focus is on areas with wood poles. Only 10%-15% (estimated) would be reworking semi-hardened areas. In the HFTD, there are 3500 miles of OH and 2500 miles of UG. The total miles in the service territory are 2,500 OH and 3.910 UG. About 140 miles are estimated to be reworked (in addition to the 880 miles). The wood poles being replaced are likely 50+ years old at retirement. They are replacing poles early through undergrounding and hardening. They have also introduced fiberglass poles onto the system. They also have a groundline inspection starting in around 2020 that would have increased the replacement rate for poles. They have an agreement with Cities to underground so much per year (also in the back country) – especially since 2021 as compared to historical. The biggest push for hardening has been over the last 5 years, probably a little reduced going forward. As they add more steel to the mix, that would moderate the life of wood poles.

Account E365 — Overhead Conductor

Interviewees expected OH wire would have a longer life than poles. They have been replacing poles in some cases without replacing conductor. Single pole changeouts would not trigger replacement of conductor. They have an active reconductoring program and will in some cases replace conductor when hardening the system. Undergrounding will also affect the life of conductor in the future. They are replacing conductor with covered cable (may increase the life as this becomes more prevalent – not much installed yet.) They are replacing single strand with multi strand steel conductor. Covered conductor is new to the company. Based on engineering analysis and history from other companies, they would expect the covered conductor to last as long as the bare wire. There will be areas that the conductor has been hardened but now will be replaced with covered wire (but not replacing the steel poles). With 10-year plan, expecting over 800 miles of covered conductor to be installed (about 40% could be rework). There will be some early retirements with the rework. There are no current plans to replace conductor with covered conductor outside of the HFTD area. There is no distribution conductor program to actively replace conductor. They have been adding lightning arrestors which may add more protection to conductor. Engineering would expect a shorter life based on industry norms or around 40 years for covered conductor (which has been installed for only a few years). Operationally, they see no reason to materially increase the life of conductor. In the long term, covered conductor may extend the life of the account as it becomes more prevalent in the mix. Current life is 55 years which was stated as operationally reasonable.

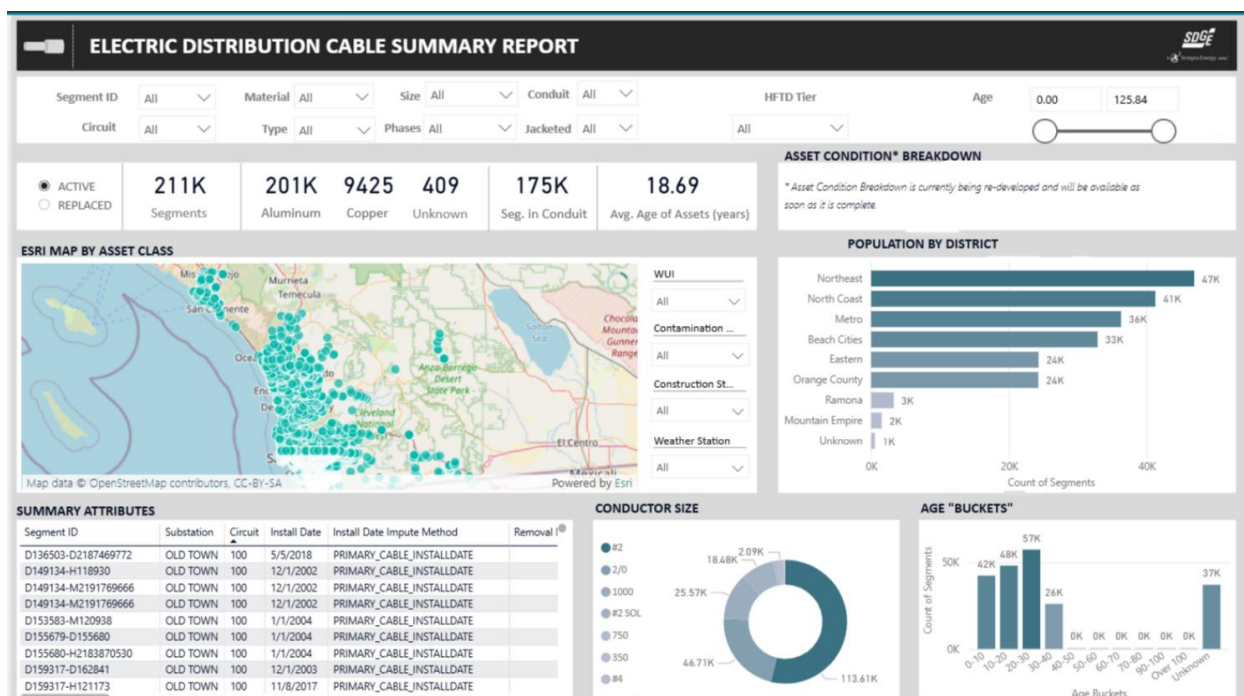

Account E366 — Underground Conduit

The interview indicated a shift away from soil-compacted backfill to slurry mixes (since the 1970s–1980s) as improved protection for conductor. Reduced proactive cable replacement was also noted as potentially extending conduit lives because conduit remains in place where cable is replaced less frequently.

Account E367 — Underground Cable

In the interview, references were made to improved connectors and materials over time and highlighted historic issues with unjacketed cable failures. As older cable is replaced with jacketed cable, SMEs expected longer life. Reduced proactive replacement was again noted as a factor that could allow longer in-place lives for both cable and associated infrastructure. The HFTD areas have less costal issues and would have less water issues overall. Current life is 45 years. A lot of the jacketed cable has been in service for 30-35 years. They are starting to see minimal failures at this point. Analytics show a slightly longer life. Operationally, the life moving longer is reasonable.

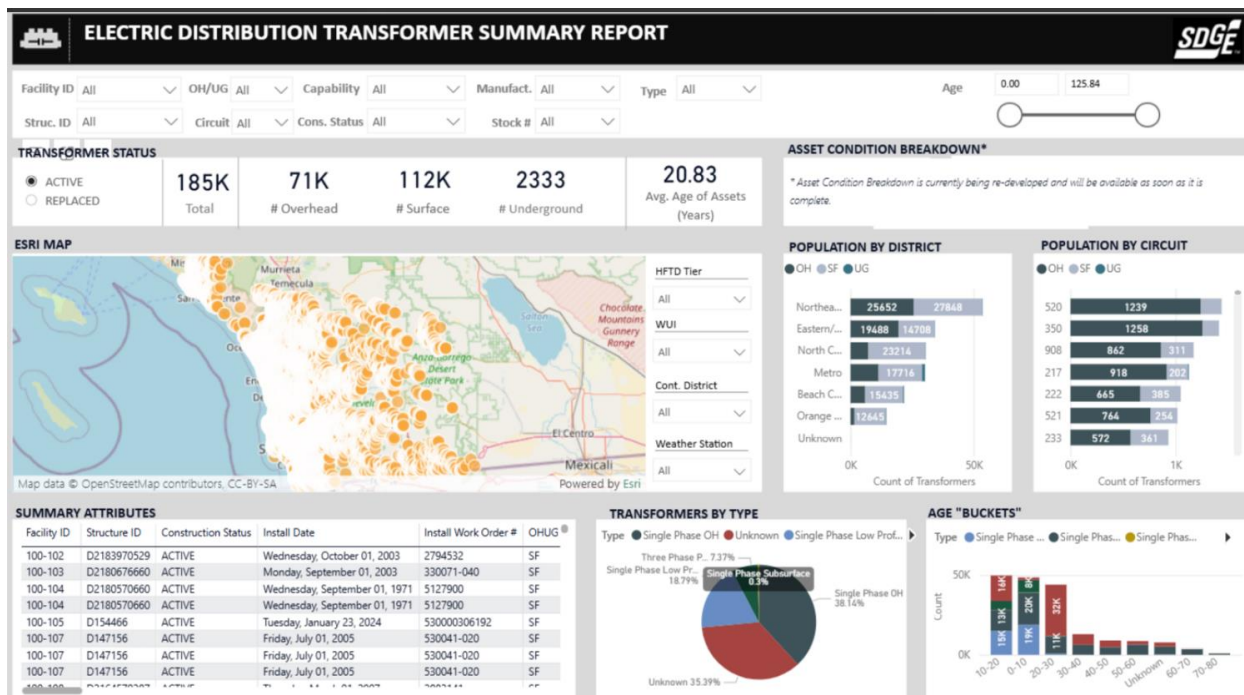

Account E368.10 — Line Transformers

The interview cited better protection and lightning arrestors and reduced repair of older transformers as supportive of modestly longer lives; hardening projects may trigger changeouts of transformers/capacitors and related pole-top equipment as needed in high fire threat areas. Countervailing factors were also noted—higher loads (including EV-driven) may trigger earlier capacity-driven replacements, with potential reuse of undersized units in lower-load areas.

Current life is 34 years. Analytics show a slightly longer life in the 37-year range. Given better materials and upgrades, slightly longer life makes sense operationally. They are starting to see higher loads (do to EVs, etc.) that will trigger shorter lives for transformers. They are looking at ways to reuse undersized transformer in other areas that need less

capacity. There is a balance between overloading transformers and reusing where loads are less.

Account E368.20 — Capacitors

Interviewees did not identify material changes expected to affect capacitor life; however, future moves toward more advanced communications/SCADA-type devices could affect replacement timing from a reliability/technology standpoint. The notes also distinguished maintenance “like-for-like” work versus capital replacement.

Account E369 — Services

Interviewees described a “run to failure” posture for services with no active proactive replacement program; operationally, underground services were expected to have slightly longer lives than overhead. Improved underground hardware/materials and testing practices were cited as factors that could extend underground service life; legacy paper-lead cable is replaced when encountered.

OH – Would expect a longer life for UG than OH. There is no proactive replacement program – they would “run to failure”. If a service failed due to a connection, they would just put back up. There used to be an active proactive replacement program but not any longer. Current life is 55 years. Operationally, move to a longer life would be reasonable.

UG – increasing levels of underground is happening. They are installing better hardware that would tend to increase the life. They just updated their cable to better-quality material. They no longer use paper lead (1920-1960) and will replace when found. They moved to in-conduit (in the early 1960s) services – fewer outages, etc.... Around the time of changing to conduit, they also started using XLPE. They are testing all UG cable and that could affect the life (extending). Current life of 53 years should be longer.

Account E370.10 — Meters (electromechanical / opt-out)

Interviewees indicated there are very few electromechanical meters left on the system (mostly opt-out), with proactive measures to replace old meters. The population includes a mix of electromechanical and solid-state non-communicating opt-out meters (noted as ~2–3k, subject to check). Current life noted as 48 years, with analytics showing a large drop that was acknowledged; it was suggested blending the lives based on mix to derive an average.

Account E370.11 — Meters (electronic / smart)

Interviewees referenced a mass deployment in 2009–2010 and observed increased early failures attributed to internal capacitor failures and certain manufacturing/display issues in those vintages. Some infrastructure was described as lasting ~10–12 years in practice; current life noted as 15 years with failures increasing, including firmware-related issues. Smart meter 2.0 is planned; the interview participants indicated SDG&E’s SMEs stated life assumptions should be shortened, while also noting a 15-year expectation may still be reasonable and future deployments may last up to 15 years.

Account E370.2 — Meter Installations (old)

Interviewees indicated meter installations are capitalized when service is established and retired when the location goes away. Current life was noted as 48 years, with analytics showing a reduction in life, that was acknowledged, similar to Account 370.10.

Account E370.21 — Meter Installation (smart meters)

For large customers, PTs or CTs could be part of the account. Interviewees indicated meter installations are expected to have a longer life than the meters themselves. Current life was noted as 15 years, and analytics showed a 15-year life consistent with Account 370.11 that was acknowledged.

Related metering equipment

Interviewees referenced CTs/PTs having ~30–40-year lives and indicated that when smart meters were rolled out, existing transformers were generally continued in service. They also referred to a 10-year life being used for network hardware such as routers and repeaters.

Account E371 — Installations on Customer Premises

They are migrating to LED for this account as current lighting fails. No active program to change from HPS to LED. Current life is 34 years. Seeing a slight reduction in life where there are indications. Operationally the life of about 30 years makes sense. They would expect the life to shorten as bulbs burn out and the heads are retired and replaced with LED (instead of replacing the bulbs under O&M). Dusk to Dawn lighting. They would expect around the same life as the streetlights. It was suggested to hold at the current life.

Account E371.10 — EV Charging Stations

Interviewees indicated an initial life expectancy of ~10 years; a prior request for a 5-year life (2019 GRC) was moved to 10 years by the Commission. Early field experience cited removals due to lease issues and reported replacements within ~5 years driven by weather exposure, electrical problems, and damage/theft; communications devices within chargers were also noted as potentially requiring replacement due to technology changes (e.g., 3G to 4G to 5G). They are having to replace most assets within 5 years. They don't hold up to weather, they have electrical problems and get damaged or stolen. Without these issues, they may be able to run for 10 years.

Account E373 — Street Lighting

They are migrating to LED for this account as current lighting fails. Replace on burnout. No proactive program to convert from HPS to LED. Currently life is 36 years, which remains in the reasonable estimated life range. They would expect the life expectancy to shorten in the future as bulbs burn out and the heads are retired and replaced with LED (instead of replacing the bulbs under O&M). Replacing EPS and LPS with LED. Historically, some of the components would fail and be replaced under O&M. With LEDs, they will replace the whole head (which would be a capital item). There has not been any material operational change or change in material in recent years related to the poles. In some cases, lights have not been changed due to lack of funding or lack of stock. The LED bulbs would be expected to last 10 years. The current life would still be reasonable at this point. At some point, the life expectancy will decrease due to the LED capital would only last 10 years and with all else equal, the overall life will decrease.

Wildfire Mitigation Program (WMP)

Interviewees described wood pole test-and-treat practices intended to extend pole life, including a recent switch to a more effective treatment chemical. Broader mitigation actions emphasized wood-to-steel pole replacement programs, undergrounding, fuels management via right-of-way clearing, and more proactive inspections/standards updates (e.g., steel poles and fiberglass/steel crossarms) intended to reduce ignition risk and improve resilience/survivability.

1. They have been doing wood pole test and treat (with fumigant) for 40+ years. They switched to a new chemical in recent periods that they believe will be more effective. The biggest mitigation is replacing wood poles with steel. For distribution, since 2004, they started using direct buried steel. After the 2007 fire, they started going much more aggressively in wood to steel (Transmission much more aggressive starting in 2008, and distribution in 2009-2010). Also, spans of over 500 ft in length, they were targeting hardening the poles or shorten the span. In 2012-2013, started the Fire Risk Mitigation (FiRM), focusing also on conductor. After that, developed a stronger risk management process to target higher risk areas/spans. Over 800 miles have been completed to date. Wood/steel program (transmission) would have underbuilt distribution hardened. In total, perhaps 1500 miles have been addressed (a significant amount of fire prone areas of 3300 miles). Undergrounding is also impactful (starting in 2019) for WM – mostly 12kV distribution (348 miles undergrounded). Some additional in the Cleveland National Forest (CNF). In the last few years, they implemented fuels management which would clear “fuels” from the ROW.

2. Most of the poles being replaced are from 40 years to 70 years old. They target specific lines where the majority of poles on the line are older, but not necessarily all. Some newer poles would have to be replaced to handle higher loading. Some other areas have been replaced that are attacked by woodpeckers – sometimes as young as 15 years old (moving to steel would decrease the impact of wildlife). FIRM is focused on small copper wire (#4 - #8) to replace with covered wire and will replace poles as well. They will also wood crossarms with fiberglass and replace insulators with polymer. In most cases, they will also replace all other equipment on the pole. They will upgrade any electronic as well.
3. Wood poles have to be disposed of in a Class 3 landfill (at a cost). Majority of other scrap is steel – which doesn't have much value.
4. Removal Costs in general are calculated from the design of the job (Compatible unit estimating). Third parties generally submit total cost, and the estimate splits the labor. Internal crews will charge one WO.

Vegetation Management

Enhanced tree trimming is a compliance issue that would better protect line. There is a decrease in faults in recent years due to the additional effort. They have optimized the scheduling in the last couple years to make sure the highest risk areas are worked prior to fire season. The amount of clearance for poles with equipment has increased. The use of LIDAR in the past has started to be used to identify hazard trees. VM is a regulatory requirement, but it also will protect the equipment on the ROW. They are taking clearances out to 50 feet were the data will show a benefit. They also do life cycle studies that would show the reduction in VM costs if going UG. They are doing additional hazard tree inspection and abatement. They are doing multiple and redundant inspections to look for hazards.

Accounts E375 and C390 — Structures

Interviewees indicated SDG&E makes changes to leased facilities more frequently than to owned facilities and has made significant investments in recent years (leasehold improvements, system hardening, generators, security, HVAC, landscaping), ranging from ~\$25k to ~\$30M. A Critical Asset Security Project (CASP) was referenced as likely fitting in the "E" category with mixed lives (shorter-life electronics such as card readers/cameras alongside longer-life fencing/guard buildings). Interviewees referenced upcoming "ground up" projects that may trigger retirements (e.g., Kearney) and cited typical component lives: generators 15–25 years, HVAC 15–20, roofs 20–25, security systems 7–10 (or 5–7 in some

cases), carpet ~10. Operationally, moving overall building life modestly longer (to ~40 years) was described as reasonable.

Account C391.1 — Office Furniture

Interviewees referenced prior refurbishments in the early 2000s and current refresh efforts, with safety/ergonomics component driving upgrades. Some furniture approaching ~20 years was described as needing replacement due to parts availability and standards changes. The existing 18-year life was described as reasonable based on experience; disposal may involve paying a salvager to remove furniture.

Account C391.2 — Computers

Interviewees indicated a 5-year life is operationally reasonable.

Account C393 — Stores Equip

Interviewees indicated this is a small population (noted as 3 assets) that may be replaced due to remodeling; a 25-year life was described as operationally reasonable.

Account C392.10 — Transportation (Autos)

Interviewees indicated nearly all vehicles are leased; legacy leases are capitalized after lease end and are expected to come off the books in the next couple of years. Most units were procured in the mid-2010s. It was referenced that there is expected residual value at end of life.

Account C392.20 — Transportation (Trailers)

Interviewees referenced trailers as linked to the broader transportation discussion; for Electric.

Account C392.30 — Transportation (Aviation)

Interviewees indicated SDG&E owns two helicopters with an average 40-year life span (example retirements noted as 2057 and 2062 for specific models). UAVs are also included and generally were described as having ~5-year lives, with technology advances causing some replacements in as little as 2–3 years; interview participants suggested splitting UAVs into separate subgroups. Residual value was described as potentially small at end of useful life.

Account C394.31 — Garage Equipment

Interviewees indicated some assets (e.g., lifts) could last up to ~30 years, while others (air compressors, shop tools) may be closer to ~10 years. Overall, an average of ~15–20 years was described as operationally reasonable, with no changes identified that would suggest a different life than currently approved.

Account C394.11 — Portable Tools

Interviewees indicated roughly two-thirds of the total is ruggedized laptops/MDTs used in the field and flagged that a 23-year life is not reasonable for laptops (more likely ~5 years).

Account E394.11 — Portable Tools

Interviewees indicated the current life was 27 years but that much of the population would be expected to have 5–10-year lives (often closer to 5 years) including hand tools, chainsaws, cameras/electronics, ladders, digging tools, live-line tools/rubber goods, hoists, drills, and similar items. Longer-lived examples included fault-finding equipment (~10–15 years), conductor pullers and associated equipment (~10–15), and some pumps/generators (~10–15). Interview participants indicated moving to an overall average of ~10 years is operationally supportable.

Account E394.20 — Shop Equipment

Interviewees indicated this population is mostly test equipment (e.g., hot-stick testers, glove testers) and could last longer than 15 years (perhaps 20–25). Leaving the current 26-year life was described as operationally reasonable. Common – Oil purifier (installed in 1997) is main asset. Consider matching to the electric account life Should have life similar to lab equipment. 15 years before replacement

Account C394.21 — Shop Equipment

Interviewees referenced an oil purifier installed in 1997 as the main asset and suggested aligning life with electric/lab-equipment expectations; ~15 years before replacement was referenced.

Account E395 — Laboratory Equipment

Interviewees indicated metering-related electronic testing equipment is technology-driven and would have a shorter life than some current assumptions; expected lives were described as ~10–15 years, with 10 years described as operationally reasonable. Interview participants also mentioned that manufacturers may stop supporting equipment and that partial upgrades (e.g., panels) may sometimes be possible without full unit replacement.

Account E397.30 — Communication Equipment

Interviewees indicated low-voltage cabling and video conference systems are technology-driven with expected lives of ~4–7 years (generally less than 10). The interview participants suggested aligning expectations with computer equipment. They also indicated most assets are in substations (e.g., ~95% in 397.2, 397.6 - SWPL has 32% in substations, and 397.1 is 22% substations.) and that a 30-year life appears long, with a potential step-down (e.g., toward ~15-20 years) discussed. Interviewees indicated a broad range of lives from ~5 years to 15+ years and suggested an average of ~13 years appears reasonable.

Account C397.30 — Communications Equipment / Video / Internet wiring

Interviewees indicated a ~5-year expectation for communications equipment and video conference equipment. Internet wiring was referenced as ~10 years, except spectrum licenses described as perpetual as long as threshold usage continues; interview participants suggested setting to 15 years for the communications equipment.

Account E398.10 — PPE / uniforms

Interviewees indicated ~5 years would be appropriate, with uniforms rotated out every ~3–5 years.

Production — Palomar

Interviewees described Palomar as ~588 MW with mixed run time (cycling and some base load) and a planned retirement date of 2036. Since commissioning (2006), the site has had capital improvements and replacements (e.g., cranes, exciters total replacement, LCI partial replacement, control system evergreen upgrades). Upcoming work referenced includes hot gas path hardware replacement/refurbishment in 2025–2026 and major outages in 2028 and 2030.

Production — Miramar

Interviews indicated Miramar units entered service in 2005 and 2009 (two GE LM6000 units) and operate as true peakers. The site has had control system upgrades and some site upgrades/capital replacements over time, with a planned retirement date of 2032 and an expectation of relatively few additions/replacements through end of life.

Production — Cuyamaca (CPAP)

Interviews indicated the plant was purchased in 2012 (initial in service 2002) and has upgraded controls, black start generators, and low operating hours. Planned retirement date was noted as 2027, with an expectation of limited wear-related replacements; interview participants indicated it would be fully depreciated in 2027.

Production — Desert Star

Interviewees indicated the plant entered service in May 2000 (2-on-1 501FC+), is on leased land, and had a lease extension extending beyond 2027 (with additional long extensions referenced). The lease was extended to 2/10/2045 with effective date 2/11/2025. CTs are under LTSAs; recent and near-term work includes generator rotor replacements (noted for 2025 and January 2026). There were referenced assumptions around decommissioning/removal timing and an open item regarding whether full depreciation includes cost of removal for units, plus a suggestion (placeholder) that future additions might be depreciated at an indicative rate (e.g., 10%) when they occur.

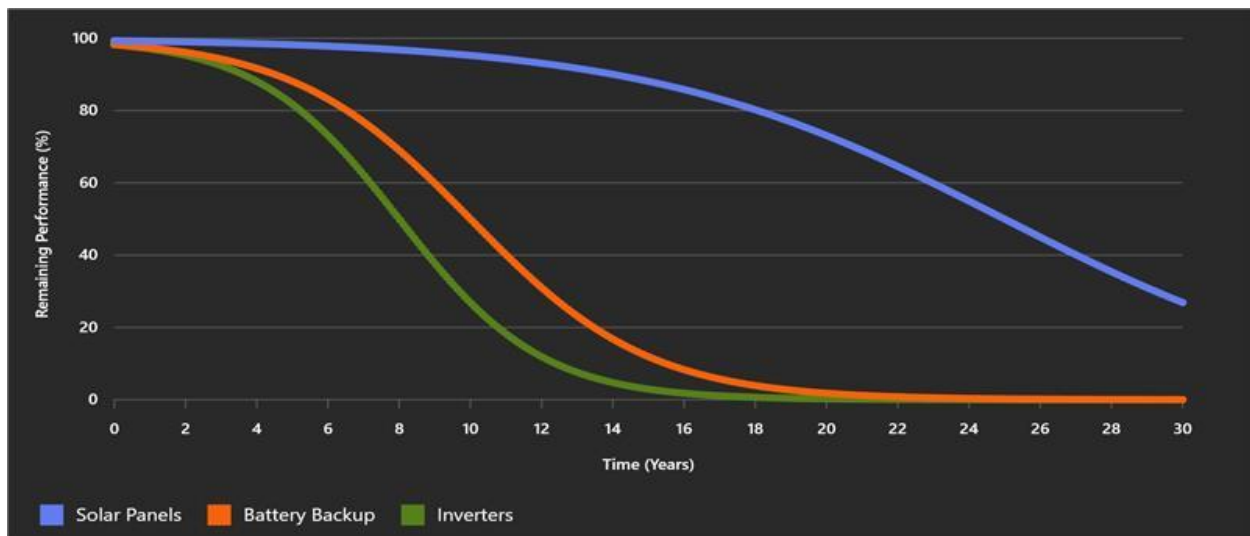

Renewables / New Technology — Solar PV

Interviewees indicated SDG&E solar assets are PV only (no concentrated solar) and referenced Ramona as the largest project to date (4 MW) with newer ground-mount projects (e.g., Cameron Corners). Manufacturer panel warranties were described as 25 years (industry standard). There was also referenced a “Sustainable Communities” program with 10-year lease terms (so 25-year life may not apply uniformly) and an expectation that remaining leases end by ~2031. Inverters were noted as likely shorter-lived (e.g., 5–10 years) with limited replacement history to date; panel degradation was referenced at ~0.3–0.8% per year.

FERC E338

Solar assets

Only Solar PV – no concentrated solar. Ramona is the biggest project to date (4 MW). Just started projects that are ground mount (e.g., Cameron Corners). Manufacturers (Canadian Solar) Warranty is 25 years. This is the standard in the industry. A program called Sustainable Communities had a 10-year lease term so 25 years would not be accurate for that project, but will be closing it down as the remaining leases end (only 22 sites left – by 2031 all closed down). A lot of the PPAs signed with third parties are 20-25 years agreements. They have examples of where there was not much reusable asset. At the end of a project, it is likely that the full site would be replaced so setting the 25-year life for all accounts may be reasonable. For interim retirement, assets like inverters may only last 5-10 years. They haven’t replaced any inverters (although Cameron Corners is pretty new). First inverter replacement may be under warranty. There is not enough experience to know the real failure rates - the expectation will be that they will have to be replaced well before the panels. Minimum capital threshold is \$10K. Panels would generally be replaced under O&M. The weather station may have some capital replacements, but they would not likely be material (but not in Solar accounts). 0.3-0.8% degradation per year. Inverters would have a shorter life and may be modeled at 7 years with an S2 curve. Operationally (and industry norm) would be a 25 year life.

The data in that chart wasn't pulled from a real-world dataset—it was **modeled in Co-pilot using typical industry averages and assumptions** based on published lifespan ranges for each component:

- **Solar Panels:** Assumed midpoint at 25 years with slow degradation (based on common 25–30 year warranties and ~0.5% annual degradation).
- **Battery Backup (Tesla Powerwall):** Assumed midpoint at 10 years with faster decline (based on 10-year warranty and typical lithium battery cycle life).
- **Inverters:** Assumed midpoint at 8 years (reflecting common replacement intervals of 10–15 years).

Renewables / New Technology — Fuel Cells

Interviewees referenced operations requesting sub-account treatment with an average life of ~10 years, citing a fuel cell at JD Labs to be overhauled and restarted with a new ~10-year life aligned to warranty and an LTSA to be signed. The interview also referenced 3–4 fuel cells at substations originally placed in service around 2018–2019, with 10 years described as operationally reasonable.

Renewables / New Technology — Hydrogen Energy Storage Systems

Interviewees referenced hydrogen storage/production systems with component lives differing by function (electrolyzer, tank, fuel cell) and described a Palomar HSS project in service in 2023 tied to the powerplant retirement in June 2036. Components referenced include storage, electrolyzer production, compressor, blending/injection skid, and a hydrogen fueling station, with no major replacements anticipated in the interview.

Renewables / New Technology — Battery Energy Storage Systems (BESS; Li-ion)

Interviewees indicated Li-ion represents ~99% of the fleet and referenced unitization and decommissioning studies (with an action item to provide materials and to determine

decommissioning costs for study and ARO purposes). Component guidance included: batteries ~15 years; inverters (bi-directional) ~7-10 years; GSU tied to station transformer life (GSU possibly ~40 years referenced); conduit like Account 366; and structures/collector system often treated with structure-type lives (~30 years referenced). It was also suggested computer/communications should align with Account 39X computer accounts and referenced a warranty replacement event for a GSU.

Renewables / New Technology — Flow Energy Storage Systems

Interviewees referenced flow batteries having ~25-year LTSAs (subject to contract review), with examples including Cameron Corners (Iron Flow) and a procurement process involving Sumitomo (VRF). These were described as a minor portion of total storage relative to Li-ion.

Integrity Programs — DIMP (Gas Distribution Integrity Management)

Interviewees indicated DIMP started around 2011–2012 and includes an active common pipeline replacement program (noted as ~120 miles/year for SoCal with ~50 miles/year for SDG&E and escalation), spanning mains, services, and meter set work. Programs referenced include protecting meter sets from vehicle damage and riser cleaning/wrapping to extend riser life (noted as implemented at SoCal; SDG&E noted as done with the meter set program). Interviewees referenced targeting pre-1986 plastic, the Aldyl-A population (numbers cited as subject to check), and an expectation that newer replacement pipe should last longer than replaced vintages.

Integrity Programs — TIMP (Gas Transmission Integrity Management)

Interviewees indicated TIMP has been in place for 20+ years with multi-cycle inspection programs (typically 7-year cycles, some 5-year), using pigging and other assessments to identify issues for repair, recoat, or replacement. Technology improvements were described as finding more issues earlier, enabling less invasive repairs and better corrosion-threat management (e.g., cathodic protection). Interviewees referenced overlaps with other programs (e.g., GTSR, PSEP) and the role of PHMSA as a primary regulatory driver.

Integrity Programs — SIMP (Storage Integrity Management Program; SoCal Gas)

Interviewees described SIMP as focused on wells, wellheads, and reservoirs with increased inspection/analysis requirements beginning in earnest in 2016–2017, including replacement of wellheads/tubing, casing remediation (e.g., new inner strings), and some early asset abandonments. With increased inspection rigor and regulation (CalGEM and PHMSA), interview participants indicated life expectations may decrease for certain subsets, while also noting many wells received inspection-period extensions (e.g., 2 years

to 7 years) and that new inspection technology (e.g., Dark Vision) may support further extensions.

Account G376 - Gas Distribution — Mains

Interviewees indicated it is difficult to specify an end-of-life for newer poly due to limited experience, while older Aldyl-A pipe is expected to have shorter life than newer generations. SDG&E's historically cathodically protected steel pipe may suggest longer life than systems with less consistent protection. Interviewees indicated proactive repair/replacement funding can correct issues earlier and may modestly extend overall life expectations; operationally, no factors were identified that would move life from the currently approved 69 years.

Account G376.6 — Hydro Test Costs

Interviewees described two accounting approaches for hydrotests depending on pipeline circumstances: (1) tests for missing documentation treated as capital (PHMSA referenced as 100% capital), and (2) state-required work largely O&M with only added capital items capitalized. Depreciation life guidance in the interview was to set life to the remaining life of the underlying pipe (and apply this logic across hydrotest categories).

Account G378 - Gas Distribution — M&R Station Equipment

Interviewees referenced a study from two rate cases ago and indicated a large portion of regulator stations were already 24+ years old (possibly ~30 now), with ~500 stations total. Replacement drivers include capacity needs, outdated designs, unsafe locations, parts availability, and corrosion. Interview participants indicated SDG&E averages ~2 station replacements/additions per year over the last decade, with a more reactive approach than SoCal; operationally, no reason was cited to increase life, and current approved life of 41 years was described as reasonable.

Account G380 - Gas Distribution — Services

Interviewees indicated service risers above ground are vulnerable to damage (e.g., weed eaters, fertilizer, customer dig-ins) and services are more likely to be changed than mains; services are often replaced when mains are replaced (e.g., Aldyl-A main replacements) or when prior leaks occurred. Interview participants stated analytics showing a 97-year average life was far above SME expectations, with many replacements closer to 50–65 years; avoiding stranded steel services was cited as a factor that could shorten service life.

Account G381 - Gas Distribution — Meters

Interviewees indicated meters may last to the currently approved 41-year life, citing an aging meter population with limited issues and a correction factor on customer bills (2% credit) that reduced the need to change meters. Interview participants also referenced industry consolidation in meter manufacturers and evaluation of ultrasonic meters (with sealed batteries supporting ~20-year life), though not yet a material installed base.

Elster/Honeywell Quality Failure Update

AC250 (N319011) & AC250NX (N319013) Gas Meter

- Status for meters installed and removed from the field as of this 11/04/2024
- 2,054 out of 2,174 meters changes have been completed and 120 pending orders remain
- 918 out of 12,591 meters need to be removed from truck/base inventory and returned to Pico Rivera for remediation

Row Labels	Meter Change Completed
N319011 - AC250	1,489
N319013 - AC250NX	565
Grand Total	2,054

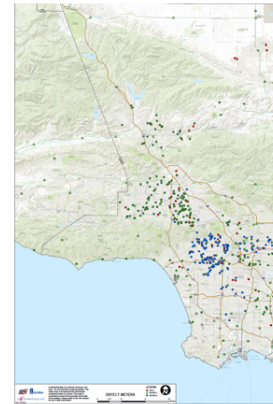

Row Labels	Pending Meter Change

Elster/Honeywell Quality Failure Update

AC250 & AC250NX Gas Meter

1. Original forecast of 1,550 meters to be changed has been updated to ~3,092 (Assuming 918 meter on truck or at bases get installed)
2. Dispatch cost to enter work order for meter changes will be included in cost recovery
3. AC250 & AC250NX unaccounted on trucks or base inventory to be returned to Pico Rivera is 918
4. CSF committed to complete by year end

	Estimated Minutes	Loaded Labor Costs	Overall Cost			
Dispatch to Create Orders	5	\$ 72.29	\$ 6.02	0.083333		\$ 6.02
Meter Replacement	45.5	\$ 89.98	\$ 68.23	0.758333		\$ 68.23
Drive Time	15	\$ 89.98	\$ 22.50	0.25		\$ 22.50
			\$ 96.75			
Estimated Replacements	Overall Labor	Total Incurred				
3,092	\$ 96.75	\$ 299,164				

Account G381.01 - Gas Distribution — Meter Modules

Interviewees referenced Itron 2.4 GZ modules with increasing failures and no battery replacement capability. Original deployment was noted as ~2009–2011; AMI 2.0 is planned for deployment in 2030–2031. Interview participants indicated SDG&E would support a 15-year life for modules to align full depreciation with the planned AMI 2.0 rollout.

Account G382 - Gas Distribution — Installations

Interviewees indicated most new installations are pre-manufactured (J-bar) with the regulator between the riser and J-bar. When the meter is replaced, the rest of the piping may be replaced when necessary; interview participants indicated the meter set assembly (MSA) is believed to last as long as the meter.

Account G385 — Industrial Meter Stations

Interviewees indicated there are 3–4 custody transfer meters on the SDG&E system (mostly in transmission) with field testing or changeout every 10 years (and routine calibrations every 6 months). Meters may be refurbished and redeployed, with potential overall life of 25–35 years given the 10-year refresh cycle.

Account G387.11 — Other Equipment (GEMS)

Interviewees stated the 15 year life for SoCal would also be applicable to SDGE.

Account G387.12 — CNG Equipment

Interviewees described CNG vehicle fueling stations (compressors, piping, fire protection, infrastructure) with a history of installations in the 1990s and multiple retirements; three stations were noted as remaining after one retirement, with two later installations in 2014 and 2017 and refurbishments at several sites. Moving to a 20-year life (to match SoCal Gas) was described as reasonable.

Account G394.1 — Portable Tools (Gas)

Interviewees indicated using SoCal Gas as a proxy for this account.

Account G394.0 — Shop Equipment (Gas)

Interviewees referenced a boring machine and cabinet as major assets and indicated recent upgrades (e.g., CNC replacing manual equipment). Interview participants suggested a significant decrease in life for newer electronic equipment would be reasonable.

Account E398.00 — Misc. Equipment

Interviewees referenced ~\$335k of fusion equipment (2016) used for training. If used in the field, life might be ~10 years or less; in training, it may last longer. Operationally, 15 years was described as reasonable.

PHMSA Mega Rule capitalization

Interviewees indicated the PHMSA Mega Rule recommends capitalization of certain testing activities for older pipe, with SDG&E planning to capitalize these costs in a separate sub-account. Interview participants indicated depreciation should likely be based on the remaining life of the underlying pipe with no net salvage.

Account G363.6 — LNG Facility

Interviewees indicated SDG&E owns a small LNG facility installed in 1956 with original tanks/vaporizers, while cryogenic components, alarms/controls, and valves have been replaced over time. Alarms/controls and similar instrumentation were described as ~10–15-year life. Interview participants indicated that overall average life could be similar to CNG, with ~20 years described as reasonable.

Account E387.30 Energy Storage

It was emphasized alignment of asset-life assumptions across comparable equipment: the generating step-up (GSU) transformer should follow the same life as a substation transformer. Interview participants also referred to extrapolating a decommissioning study across battery sites using MWh as the scaling basis.
